

Reply to comments for implentation of BPL internet over power lines.

I am opposed to this methodology of broadband using open-air wire transmission as proposed by ALL the petitioners for this service as a function of virtually destroying or rendering incapacitated, the communications services as guaranteed for the Amateur Radio Service as well as, GOVERNMENT, MILITARY, and related COMMERCIAL services in the high frequency spectrum. Tests have been conducted and found unacceptably high, (50uv/m) or more, (S9) signal levels that would have serious, if not completely obliterating emergency communications and vital public service functions. Southern California is a VERY HIGH seismic danger area, and this would cause serious communications problems. That is just one problem area, there are others.  
Kenneth A. Hanson W6MRN Retired TV-Communications engineer.
